

ABSTRACT OF THE DISCLOSURE

A suspension lamp includes a switch box, a wire connection base, a plurality of connecting terminals, and a plurality of electric wires. The wire connection base includes a support seat, a cap, a spacer, a first circuit board, a second circuit board, and a plurality of protective jackets. Thus, the operator only needs to mount each of the connecting terminals on a respective one of the protective jackets of the wire connection base so as to form an electrical connection state, so that the electric circuit of the suspension lamp is connected easily and conveniently, thereby facilitating the operator mounting the electric circuit of the suspension lamp.
